

Concealed Magazine Slot Arrangement for Chest Harness, Midriff Harness, Vest, or the Like

Abstract of the Disclosure

5 A concealed magazine slot arrangement includes a magazine holder, a gear carrier, and a fastening device for fastening the magazine holder on the user's body. The magazine holder includes an inner panel, an outer panel, having a front operation side, overlapped thereon, and a plurality of slot dividers affixed between the inner and outer panels to form a plurality of magazine slots concealed within the inner panel, the outer panel, and the slot dividers for receiving the magazine. A gear carrier is provided on the front operation side of the magazine holder for carrying a gear thereon. Accordingly, the magazine holder is warped for fitting a curvature of the user's body, such that the outer panel is reinforced to substantially bias against the inner panel to physically self-adjust a shape of the magazine slots for retaining the magazine within the respective magazine slot of the magazine holder.
